

SnapSalon Aura

Your Private AI Style Passport

SEE IT. SAY IT. SAVE IT. BOOK IT.

SNAPDRAGON AI LAB

**BUILT FOR SNAPDRAGON-POWERED HP
PCs**

01 | The problem

A photo shows a look. It does not explain the user's intent.

INSPIRATION

"I want this hairstyle."

But a reference image cannot communicate every preference.

COMMUNICATION GAP

"Keep this... change that... not too much maintenance."

Customers often struggle to express the details.

CLOUD DEPENDENCY

Personal photos and voice can become cloud inputs simply to get useful AI assistance.

The opportunity: turn multimodal AI into a communication tool, not another chatbot.

02 | The big idea

A local Style Passport that remembers what the user actually wants.

The AI remembers explicit preferences — length, maintenance tolerance, occasions, saved looks and feedback — rather than learning hidden personal attributes.

03 | The signature feature

BARBER BRIEF — the AI output is a useful artifact.

REFERENCE Visual description of the requested style.	INTENT Keep / change / avoid — based on what the user explicitly says.
MAINTENANCE How much daily effort the user accepts.	QUESTIONS Clarifications to discuss with the barber.
SALON-READY SUMMARY One concise brief the customer can show to a stylist.	STYLE PASSPORT Save the selected result for future visits.

04 | Why Snapdragon matters

The hardware is part of the product experience — not just the deployment target.

VISION + LANGUAGE

Qualcomm AI Hub
Qwen3-VL-4B-Instruct

Image + text → structured text.

VOICE

Qualcomm AI Hub
Whisper-family model

Voice → local text input.

EXECUTION

Snapdragon PC
NPU-first local path

Validate the supported Windows runtime on the target HP device.

Design goal: personal image + voice inputs stay on the PC during AI inference, reducing unnecessary cloud dependency.

05 | End-to-end experience

One simple loop — from inspiration to action.

Optional salon services — discovery, appointments, history — remain separate from personal-media AI inference.

06 | The 90-second judge demo

0–10s Show the reference + communication problem.	10–30s User speaks natural preferences.	30–50s Barber Brief appears.
50–65s Save to Style Passport.	65–80s Use saved preferences for a future request.	80–90s Disable network and repeat AI analysis.

Make the on-device claim visible, measurable and repeatable.

07 | What we will measure

LATENCY Local inference time	NPU PATH Execution / fallback behavior	MEMORY Runtime footprint	QUALITY Barber Brief evaluation
RESPONSIVENESS Sustained interaction	OFFLINE AI path without network	PRIVACY Verify selected inputs stay local	REPRODUCIBILITY Document device + model + runtime

No invented benchmark numbers. Final performance claims will come from the actual Snapdragon-powered HP PC.

SnapSalon Aura

Your style. Your memory. Your device.
